

Name: Kathleen Ann Borromeo

Role:Member

- **Specific Tasks performed**

The task assigned to me was to develop the Client Application (web-based), which includes login and registration features as well as an inventory interface. The system allows users to interact with different pages for authentication and data viewing. I worked on organizing the structure of the interface to make navigation simple and understandable. I also ensured that each section of the application is clearly presented to make it easy for users to know what to do when they see the interface.

- **Code Contribution**

I created a login and registration UI and an inventory UI using HTML and JavaScript. I implemented basic user input handling and page navigation to support user interaction. I also ensured that the interfaces are functional and easy to use. In login and registration, I worked on improving the responsiveness and layout of the interface for a better user experience. The interface is kept simple, as I focused more on implementing proper error handling and maintaining a clean and organized design.

Also in an inventory interface where I designed a simple table to display product information. The table includes columns such as product ID, name, price, stock, date arrived, and shelf life to organize the data clearly. I added an action column with buttons that allow the admin to edit or delete a product easily. Additionally, I placed an “Add Product” button at the lower right corner of the interface, which opens a modal form where the user can input the details of a new product.

- **Challenges Encountered**

I encountered difficulty in aligning form inputs and buttons properly in the interface. I also struggled because XAMPP was not working, which made it difficult to test whether the interface was functioning correctly, especially since it needed to be connected to the database to verify if the user already had an

account and to ensure proper login validation. It was also necessary for the system to proceed to the inventory interface after a successful login.

- **Contribution in solving the problem**

I improved the user interface by fixing form layouts and to make the application more user-friendly and visually clean. These changes helped enhance the overall usability of the pages.
